# Mineral Resources Map of Asia

Masaharu KAMITANI\*, Tetsuji OHNO\*\*, Kimio OKUMURA\*\*,  
Yoji TERAOKA\* and Yasushi WATANABE\*\*\*

\* Former staff of Geological Survey of Japan

\*\* Geological Survey of Japan

\*\*\* Akita University

The mineral resources map of Asia exclusive of Southeast Asia covers the areas of mineral resources maps of East Asia(Kamitani *et al.*, 2007) and Central Asia(Kamitani *et al.*, 2012) and the neighboring regions.

The map shows land area deposits of main metallic mineral and non-metallic mineral resources except for limestone, dolomite, magnesite and construction materials. Uranium is included, although its principal utilization is for nuclear energy. About 8,000 mineral deposits are shown on the map regardless of their status of exploration, exploitation and mined out. However, creditable and detailed mineral deposit information has not been gotten from some areas and countries because of their complicated social and political environments. Therefore, strictly speaking, the map does not necessarily represent the present resources figure.

The background geology of the Mineral Resources Map of Asia was adopted from the Geological Map of Asia, scale 1:5,000,000(Teraoka and Okumura, 2011).

The Asian continent is very complicated in geology. Consequently, the tectonic map inserted on the lower-left corner of the mineral resources map of Asia was designed to make easy to understand the major geologic features and their relation to the distribution of mineral deposits. The map was prepared on the basis of the geological map of Asia (Teraoka and Okumura, 2011).

The map area is divided into many tectonic provinces, which are Precambrian massifs, orogenic belts ranging in age from Proterozoic to Cenozoic, associated with Mesozoic to Cenozoic large-scale sedimentary basins. The oldest Siberian, Sino-Korean and Indian massifs were consolidated in Archean to Early Proterozoic tectonic movements. There are also recognized the domains of Proterozoic orogenesis such as Enisei-Biryusa, Baikal-Vitim, Malkhan-Yablenov, Higher Himalayan and Dalhi belts, and Bureya-Khanka,

Yangtze and Kontum massifs. Phanerozoic orogenic belts occur between or around the older massifs, and resulted from Early Paleozoic(Caledonian), Late Paleozoic-Triassic(Variscan-Indosinian), Jurassic-Cretaceous(Yenshanian) and Cenozoic (Himalayan) movements. The large-scale basins are filled mainly with continental, partly marine sediments, and are important in production of oil, gas and some mineral resources.

On the mineral resources map, mineral deposits sizes; large, medium and small, are figured, and some sub-economic mineral deposits including mineral occurrences are plotted in order to indicate a resource potential in individual metallogenic area.

The legend of the mineral resources map is the same as ones of mineral resources maps of East and Central Asia (Kamitani *et al.*, 2007 , 2012) and conforms fundamentally to that of the Circum-Pacific mineral resources map (Guild, 1981; Kamitani *et al.*, 1999). The commodity symbols show the metal or mineral contents of the deposits by colored geometric shapes with some modification.

The ten colors and five shapes indicated on the map's legend provide fifty combinations composed of metals, minerals and their associations.

The colors, insofar as possible, indicate metals or minerals of similar type. For example, copper, molybdenum and associated metals (tungsten, lead-zinc and nickel) are orange, precious metals (gold, silver, platinum group metals), diamond and precious stones are yellow, lead-zinc and associated metals are blue, and tungsten-tin and associated metals are red.

Three sizes of mineral deposits in Table 2 denote the relative importance of the mineral deposits. Limits among the three size categories for each commodity are mostly in terms of metric tons of the substances contained before

exploitation or an actual output. Some deposits shown as the smallest symbols on this map correspond to mineral occurrences, but they are included because they may help identify and estimate prospective areas broadly favorable for exploration planning of specific minerals. There are some differences in the deposit size categories between this map and Seltmann *et al.* (2001), Shatov *et al.* (2001), Geological Survey of India (2001) and others. Their criteria of the large-sized deposits were frequently adopted, unless the information of appropriate reserve/resource quantity of individual deposit is available.

Eleven deposit types including undifferentiated deposits shown on the map are as follows;

**Magmatic and irregular massive deposits:** mafic-ultramafic related Cu-Ni-PGE, Cr-PGE, podiform chromite and anorthosite related apatite, titanomagnetite and ilmenite deposits. REE, REE-Fe, REE-F, P and Mo are contained in carbonatite intrusives. Diamond-bearing kimberlite-type deposit consists of pipe and dykes.

**Skarn and contact-metasomatic deposits:** they consist mainly of irregularly massive sulfide-oxide minerals and are associated with veinlet-disseminated mineralization. Cu, Fe, Au, Ag, Pb-Zn, Mo and B minerals are formed in calc-silicate and magnesium-silicate skarns that replaces stratified carbonate and carbonaceous rocks. Related intrusive rocks vary in composition from quartz diorite to granite and from diorite to syenite.

**Pegmatite and greisen deposits:** Li-REE, Sn-W-F and Sn-Ta-Nb-bearing granitic pegmatites, W-Mo-Be greisen and hydrothermal deposits are closely related to felsic intrusives. They occur within endo- and exocontact parts of multistage of granitic intrusions.

**Porphyry deposits including stockwork and disseminated deposits:** Various metallic commodities of this type of mineralization are formed within intrusives and adjacent country rocks. Cu, Cu-Au, Cu-Mo, Cu-Zn, Mo and Mo-W deposits are formed by felsic and calc-alkaline intrusions, commonly tonalitic and monzogranitic plutons. Some deposits have been described as stockwork and/or disseminated deposits. Almost all of the intrusions show hypogene hydrothermal alteration including sodic, potassic and phyllitic facies.

**Hydrothermal vein and fissure-filling deposits:** Epithermal to hypothermal mineralization stage of deposits crosscut in any type of host rock and formed Au-Ag, Ag-Pb, Au-As, F, Hg-Sb, Mn, Pb-Zn±Au-Ag/Ba, Cu±Pb-Zn, Sn-W, Hg and U deposits. They are related to mafic to acidic extrusive and intrusive rocks. The major lodes of dimensions are transverse to stratification in sedimentary or volcanic hosts.

**Stratabound deposits including marine extrusive rock-related massive sulfide, volcanogenic-sedimentary deposits and stratiform/stratabound deposits:** Deposits of generally limited horizontal extent occur more or less at the same horizon in stratified rocks (Cu-Zn, Zn-Pb-Cu, Pb-Zn±Cu, Fe, Mn). They may be partly concordant or partly discordant with the enclosing rocks. Some deposits are stratiform with wide lateral extent and syngenetic with enclosing rocks. Examples are iron formation and sedimentary and exhalative copper, lead and zinc deposits. Most massive sulfide deposits belong to this category. Stratiform and stratabound carbonate-hosted Mississippi Valley-type (MSSV) of Pb-Zn deposit, sedimentary exhalative Pb-Zn (SEDEX) deposit and barite deposits are related to hydrothermal-sedimentary processes.

**Sedimentary deposits including sandstone-hosted deposits:** Deposits as massive to disseminated Fe, Mn, Fe-Mn and Cu oxide and carbonate deposits are rigorously confined to one or more layers in sedimentary rocks.

**Metamorphic deposits:** Almost all of graphite deposits are formed by regional metamorphism, contact metamorphism of coaly sediment and some talc deposits are originated from dolomitic and ultramafic rocks.

**Weathering residual deposits:** Deposits are formed by surficial chemical concentration. These deposits include nickeliferous laterite, bauxite, uraniferous calcrete and some manganese oxide deposits. The criterion is that supergene processes were responsible for producing ore grade materials.

**Placer deposits:** Deposits formed by a surficial mechanical concentration. Examples are alluvial and beach placer deposits, such as gold, ilmenite, monazite and diamond.

**Evaporite deposits:** Deposits composed mainly of minerals precipitated by a result of evaporation from solvent. Chloride, sulfate, carbonate and borate are derived from brine. Na, K, gypsum/anhydrite and phosphorite deposits are usually syngenetic with enclosing rocks. B and Li are concentrated in some lakes and brines.

**Mineral deposit numbers** are given only for 415 large-sized deposits(Table 3) on the Mineral Resources Map, and all the data including small and medium-sized deposits can be obtained from the home page of the Geological Survey of Japan (<https://www.gsj.jp/Map/EN/asia-area-geoscience.html>) of the AIST (National Institute of Advanced Industrial Science and Technology).

**Acknowledgements:** We would like to express our gratitude to Dr. M. Ogasawara, Geological Survey of Japan, National Institute of Advanced Industrial Science

and Technology (AIST), for his helpful suggestions and providing information on mineral deposits of Mongolia and Russian Far East. We sincerely appreciate Dr. S. Ishihara, former Special Emeritus Advisor, Geological Survey of Japan, AIST, who gave us valuable information on porphyry copper and copper-molybdenum deposits in Tibet, China and on metallic-and non-metallic deposits of India. Dr. Y. Togashi, former Director of International Cooperation Office, Geological Survey of Japan, provided us the Mineral Deposit Map of Central Asia and the southern Ural.

The main metallogeny and the prosperity potential of the metallic mineral deposits of the Middle East region including Iran, Pakistan and Afghanistan were suggested by Dr. J. Hedenquist, former staff of Geological Survey of Japan.

Dr. K. Naito, former staff of the Geological Survey of Japan promoted the compilation project of the Geological Map and the Mineral Resources Map of Asia. Mineral deposit data sheets of several Central Asian countries were input by Mrs. S. Miyano and other geologists.

**Table 1 Abbreviations used on Mineral resources map and in Table 3**

Commodity	Deposit type and shape	Geologic age
Ag: silver	Alt: hydrothermally altered	A: Archean
Al: aluminum	A-mts: alkaline metasomatic	C: Carboniferous
As: arsenic	Bed: bedded	Cm: Cambrian
Au: gold	Brc: breccia	Cz: Cenozoic

U: uranium		
V: vanadium		
W: tungsten		
Y: yttrium		
Zn: zinc		
Zr: zirconium		

**Table 2 Deposit sizes used on the resources map**

Size limits are shown in metric tons of metals or minerals except for diamond and precious gems in carats. Past production and/or reserves totaled.

Commodity	Size Large	> Medium	> Small
Aluminum (bauxite) ( $\text{Al}_2\text{O}_3$ )	100,000,000	1,000,000	
Antimony (Sb)	500,000	10,000	
Arsenic (As)	1,000,000	10,000	
Barite ( $\text{BaSO}_4$ )	5,000,000	50,000	
Beryllium (BeO)	1,000	10	
Boron ( $\text{B}_2\text{O}_3$ )	10,000,000	100,000	
Chromium ( $\text{Cr}_2\text{O}_3$ )	1,000,000	10,000	
Cobalt (Co)	20,000	1,000	
Copper (Cu)	1,000,000	50,000	
Diamond (Dm)	20,000	1,000	
Fluorite ( $\text{CaF}_2$ )	5,000,000	100,000	
Gold (Au)	200	10	
Graphite (fixed C.) (Gr)	1,000,000	10,000	
Gypsum-anhydrite ( $\text{CaSO}_4$ )	100,000,000	5,000,000	
Iron (ore) (Fe)	100,000,000	5,000,000	
Kaolin/Refractory clay (ore)	50,000,000	1,000,000	
Lead (Pb)	1,000,000	100,000	
Lithium ( $\text{Li}_2\text{O}$ )	100,000	10,000	
Manganese (ore: (40%) Mn)	10,000,000	100,000	
Mercury (Hg)	20,000	1,000	
Molybdenum (Mo)	500,000	25,000	
Nickel (Ni)	500,000	25,000	
Niobium-Tantalum [ ( $\text{Nb},\text{Ta}$ ) $_2\text{O}_5$ ]	100,000	1,000	
Phosphate ( $\text{P}_2\text{O}_5$ )	200,000,000	1,000,000	
Platinum group elements (PGE)	200	10	
Potassium ( $\text{KCl}$ or $\text{K}_2\text{O}$ )	10,000,000	1,000,000	
Precious gems (Gm)	20,000	1,000	
Pyrite ( $\text{FeS}_2$ )	20,000,000	200,000	
Pyrophyllite/Pottery stone (ore)	50,000,000	1,000,000	
Rare earth with Yttrium ( $\text{RE}_2\text{O}_3$ )	2,000,000	50,000	
Silver (Ag)	10,000	500	
Sodium ( $\text{NaCl}$ )	100,000,000	1,000,000	
Strontium (Sr)	1,000,000	10,000	
Sulfur (S)	100,000,000	1,000,000	
Talc (ore)	10,000,000	1,000,000	
Thenardite ( $\text{Na}_2\text{SO}_4$ )	100,000,000	1,000,000	
Tin (Sn)	100,000	5,000	
Titanium ( $\text{TiO}_2$ )	10,000,000	1,000,000	
Tungsten (W)	50,000	1,000	
Uranium (U)	50,000	1,000	
Vanadium (V)	10,000	500	
Zinc (Zn)	1,000,000	100,000

## **25. Vietnam**

Department of Geology and Minerals of Viet Nam (DGM) (1996a) Geology and mineral resources map of Sam Nua sheet, scale 1:200,000. 83p.

Department of Geology and Minerals of Viet Nam (DGM) (1996b) Geology and mineral resources of Khang Khay-Muong-Xen sheet, scale 1:200,000. 70p.

Department of Geology and Minerals of Viet Nam(DGM) (1996c) Geology and mineral resources of Thanh Hoa sheet, scale 1:200,000. 127p.

Department of Geology and Minerals of Viet Nam(DGM) (1996d) Geology and mineral resources of Xieng Khoang-Tuong sheet, scale 1:200,000. 60p.

Department of Geology and Minerals of Viet Nam(DGM) (1996e) Geology and mineral resources of Vinh sheet, scale 1:200,000. 66p.

Department of Geology and Minerals of Viet Nam(DGM) (1996f) Geology and mineral resources of Ha Tinh-Ky Anh sheet, scale 1:200,000. 85p.

Department of Geology and Minerals of Viet Nam(DGM) (1996g) Geology and mineral resources of Le Thuy-Quang Tri sheet, scale 1:200,000. 74p.

Department of Geology and Minerals of Viet Nam(DGM) (1996h) Geology and mineral resources of Mahaxay-Dong Hoi sheet, scale 1:200,000. 86p.

Department of Geology and Minerals of Viet Nam(DGM) (1996i) Geology and mineral resources of Huong Hoa-Hue-Da Nang sheet, scale 1:200,000. 94p.

Department of Geology and Minerals of Viet Nam(DGM) (1996j) Geology and mineral resources of Ba Na sheet, scale 1:200,000. 85p.

Department of Geology and Minerals of Viet Nam(DGM) (1996k) Geology and mineral resources of Hoi An sheet, scale 1:200,000. 94p.

Department of Geology and Minerals of Viet Nam(DGM) (1996l) Geology and mineral resources of Ba Na sheet, scale 1:200,000. 85p.

Department of Geology and Minerals of Viet Nam(DGM) (1996m) Geology and mineral resources of Ho Chi Minh city sheet, scale 1:200,000. 61p.

Department of Geology and Minerals of Viet Nam(DGM) (1996n) Geology and mineral resources of Cong Pong Cham-Loc Ninh sheet, scale 1:200,000. 52p.

Department of Geology and Minerals of Viet Nam(DGM) (1996o) Geology and mineral resources of Phu Quoc-Ha Tien sheet, scale 1:200,000. 64p.

Department of Geology and Minerals of Viet Nam(DGM) (1996p) Geology and mineral resources of Long Xuyen sheet, scale 1:200,000. 62p.

- Department of Geology and Minerals of Viet Nam(DGM)  
 (1996q) Geology and mineral resources of Chau Doc sheet, scale 1:200,000. 42p.
- Department of Geology and Minerals of Viet Nam(DGM)  
 (1998a) Geology and mineral resources of An Khe sheet, scale 1:200,000. 74p.
- Department of Geology and Minerals of Viet Nam(DGM)  
 (1998b) Geology and mineral resources of Buon Ma Thuot sheet, scale 1:200,000. 83p.
- Department of Geology and Minerals of Viet Nam(DGM)  
 (1998c) Geology and mineral resources of Hoi An sheet, scale 1:200,000. 94p.
- Department of Geology and Minerals of Viet Nam(DGM)  
 (1998d) Geology and mineral resources of Dak To sheet, scale 1:200,000. 49p.
- Department of Geology and Minerals of Viet Nam(DGM)  
 (1998e) Geology and mineral resources of Mang Den-Bong Son sheet, scale 1:200,000. 87p.
- Department of Geology and Minerals of Viet Nam(DGM)  
 (1998f) Geology and mineral resources of Quang Ngai sheet, scale 1:200,000. 65p.
- Department of Geology and Minerals of Viet Nam(DGM)  
 (1998g) Geology and mineral resources of Qui Nhon sheet, scale 1:200,000. 54p.
- Department of Geology and Minerals of Viet Nam(DGM)  
 (1998h) Geology and mineral resources of Tuy Hoa sheet, scale 1:200,000. 76p.
- Department of Geology and Minerals of Viet Nam(DGM)  
 (1998i) Geology and mineral resources of Dak To sheet, scale 1:200,000. 48p.
- Department of Geology and Minerals of Viet Nam(DGM)  
 (1998j) Geology and mineral resources of An Khe sheet, scale 1:200,000. 74p.
- Department of Geology and Minerals of Viet Nam(DGM)  
 (1999a) Geology and mineral resources of Gia Ray-Ba Ria sheet, scale 1:200,000. 83p.
- Department of Geology and Minerals of Viet Nam(DGM)  
 (1999b) Geology and mineral resources of Da Lat-Cam Ranh sheet, scale 1:200,000. 94p.
- Department of Geology and Minerals of Viet Nam(DGM)  
 (1999c) Geology and mineral resources of Phan Thiet sheet, scale 1:200,000. 67p.
- Department of Geology and Minerals of Viet Nam(DGM)  
 (2000) Mineral resources map of Viet Nam, scale 1:1,000,000. Hanoi.
- Department of Geology and Minerals of Viet Nam(DGM)
