

## **I. OUTLINE OF THE GH97 AND GA97 RESEARCH CRUISES ON THE TOKAI OFFSHORE AREA**

*Makoto Yuasa and Yukinobu Okamura*

### **Introduction**

This report represents the onboard research results of two cruises concerning to the AIST special research programs of "Marine Geological Investigation of Tokai Offshore Area" and "Estimation Method for Submarine Active Faults." Research area for the former program is continental shelf and upper continental slope around Izu Peninsula and off Hamamatsu, and that for the latter is lower continental slope area of Suruga Bay and Kumanonada Sea. As both areas were located side by side, the research cruises were conducted interdependently. Here we call both areas "Tokai offshore area."

The Tokai offshore area is estimated to be the seismic focal area of the Tokai Earthquake which is expected to occur in the near future. The seismic fault models have been proposed for the Tokai Earthquake. No models of earthquake fault, however, take the geological structure of the area into account because of the paucity of information of submarine geology. On the other hand, meanders of the Kuroshio current are often observed in this area. Accordingly, the sedimentary records of the area is very important to the change of the Kuroshio current accompanied with global environmental change and the materials circulating mechanisms in the ocean around Japanese islands.

Since 1974, the Geological Survey of Japan has carried on marine geological and geophysical surveys to accumulate and offer the information of marine geological data around Japan from the view points of preservation, ocean space utilization, and guarantee of submarine mineral resources. Marine geologic mapping is a main program of Marine Geology Department, GSJ to achieve the above purpose.

The goals of our research on the Tokai offshore area are as follows:

- (1) To make marine geologic maps of "Enshunada Sea" and "Suruga Bay" based on the seismic profiling and sampling works off Tokai area.
- (2) To make sedimentological maps of the above areas based on the sediment analysis.
- (3) To elucidate the seismotectonics of the Tokai offshore area.
- (4) To elucidate the material circulation and paleoenvironmental change of the area.

Those above are important goals to Japan in providing basic information useful for the elucidation of active geological structure, the exploitation of marine mineral resources, the utilization of ocean space and other various activities. Especially, if we

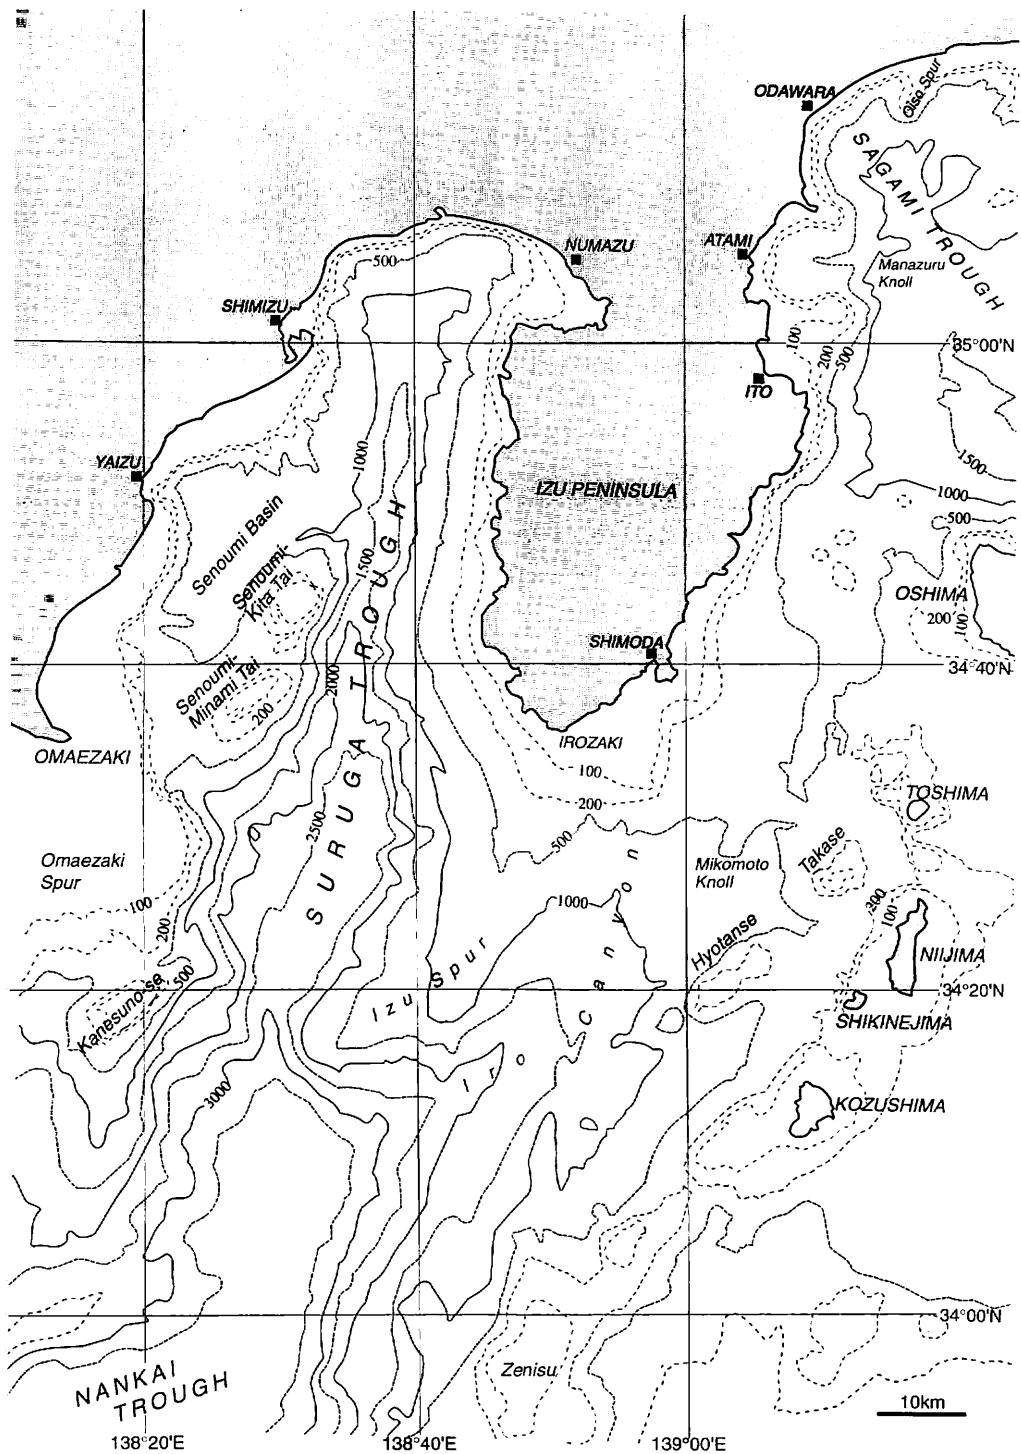

Fig. I-1 Submarine topographic map of the eastern part of the research area.

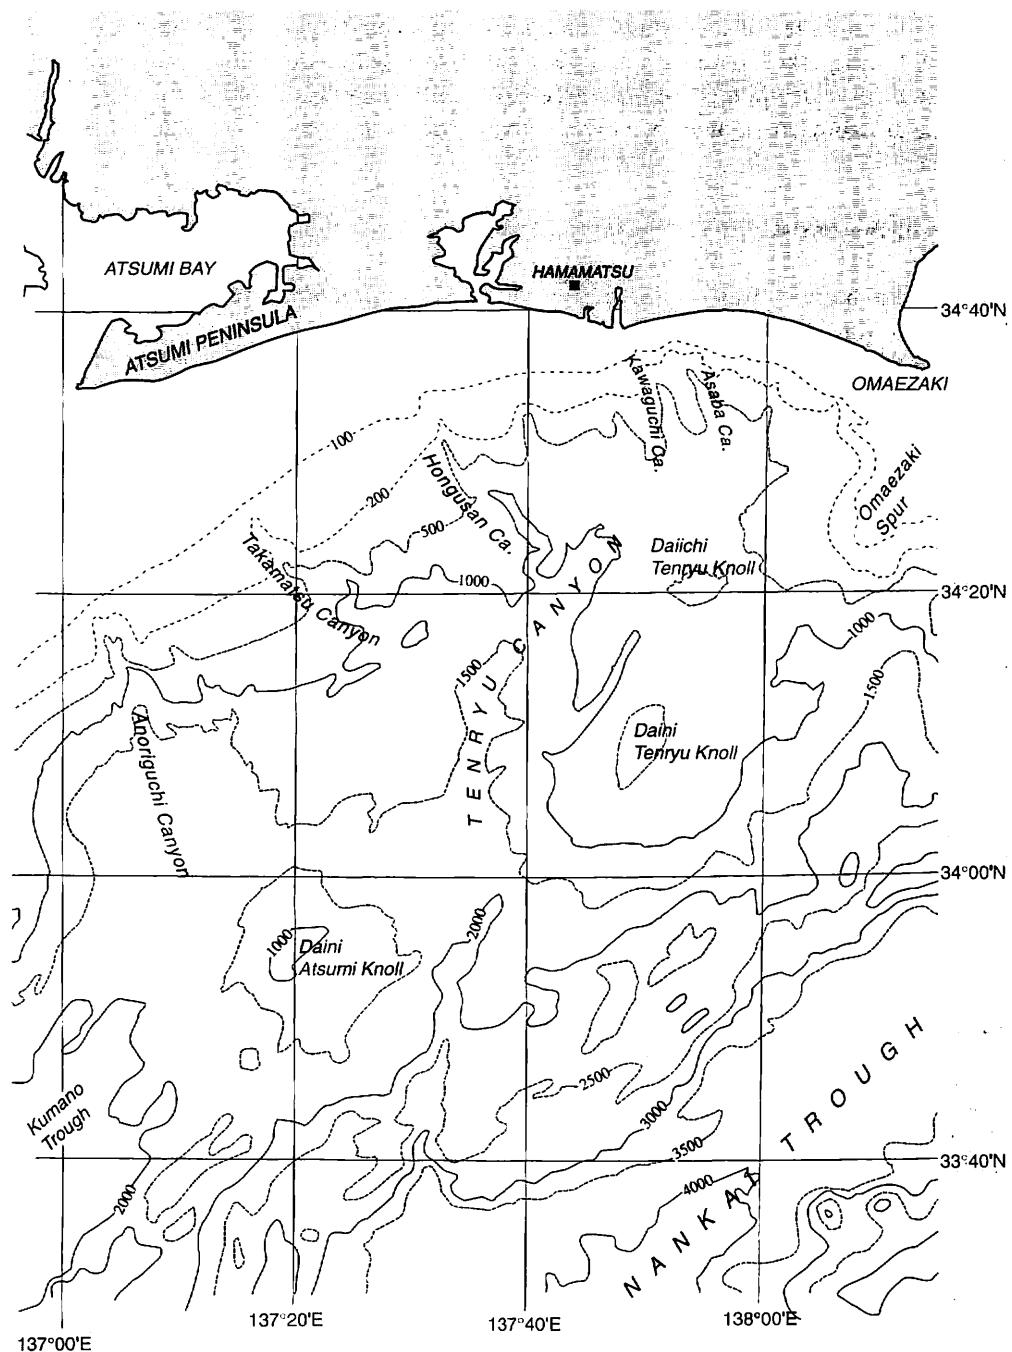

Fig. I-2 Submarine topographic map of the western part of the research area.

are able to know precisely the position and scale of the earthquake fault of “the Tokai Offshore Earthquake” based on the geological and sedimentological mapping, the confidence for earthquake damage prediction will increase. From the analysis of sediment distribution we may be able to predict the recurrence cycle of earthquake in this area.

## **Outline of the cruise**

### *GH97 Cruise*

The research cruise was carried out by the R/V Hakurei-maru for forty days from April 11 to May 20. During the cruise, the ship entered to Shimizu Port from April 29 to May 2 for supplement of oil, water and foods, and exchange of researchers. Tables I-1 and I-2 show the list of onboard researchers and the research cruise log of the GH 97 cruise.

Table I-1 Participants aboard the Hakurei-maru for GH97 Cruise.

Makoto YUASA	Marine Geol. GSJ	Chief researcher, sampling
Takemi ISHIHARA	Marine Geol. GSJ	Gravity and geomagnetic survey
Fumitoshi MURAKAMI	Marine Geol. GSJ	Seismic survey
Yukinobu OKAMURA	Marine Geol. GSJ	Seismic survey
Shin'ichi KURAMOTO	Marine Geol. GSJ	Seismic survey
Ken IKEHARA	Marine Geol. GSJ	Sampling
Hajime KATAYAMA	Marine Geol. GSJ	Sampling
Osamu ISHIZUKA	Chemistry, GSJ	Sampling
Masato JOSHIMA	Res. Consult. GSJ	Geomagnetic survey, heat-flow mes. and deep-tow survey
Yoshiki SAITO	Marine Geol. GSJ	Sampling
Masatoshi KOMIYA	Fuel Res., GSJ	Sampling
Kohsaku ARAI	Marine Geol. GSJ	Seismic survey
Wytze van der Werff	STA Fellow, GSJ	Guest researcher, seismic survey
Research Assistant		
Yuduru YAMAMOTO	Tsukuba University	
Shigeyuki TABARA	Ryukyu University	
Yumi HATTA	Hiroshima University	
Hajime HAMADA	Kumamoto University	
Motoi MATSUHASHI	Akita University	
Kumiko KITABAYASHI	Yamagata University	
Eiji TOMINAGA	Shizuoka University	
Eiji YAGI	Kochi University	
Iduru KOGAME	Hokkaido University	
Akio YAMAOKA	Shizuoka University	
Kazutaka KUWABARA	Kumamoto University	

Table I-2 Cruise log of GH97 cruise. Symbols showing kinds of works are as follows; G: grab sampling, D: dredge, P: gravity coring, M: multi-channel seismic reflection survey.

May 19 o. 18.0°C	Between Izu Pen. and Toshima Is	Seismic reflection survey and sampling work (D)	Site DL, DK					47 12	2 12					
May 20	Tokyo Bay Funabashi Port	Arriving in Funabashi Port and landing												Arrival in Funabashi Port 10:00

Field survey was conducted as the combination of seismic and other geophysical surveys during the night cruising time and sampling works in day time. Deep-tow survey was operated during day-time for the reason of winch operation and manpower while at work.

We collected about 5600 km of single-channel seismic data and about 720 km of 48-channel seismic data from the area during the cruise. At the same time with seismic survey, geomagnetic survey was conducted by using proton magnetometer. Three measurement lines by deep-towing were taken from the Enshunada Sea. Gravity measurement was continued by the onboard gravimeter through the cruise.

The ship collected 234 grab, core and dredge samples of which 207 were grab samples, 12 large diameter gravity cores, 2 multiple cores, 3 rock cores, and 10 dredge samples.

The cruise was uneventful except two minor incidents. Seismic survey was stopped at one night by the propeller trouble and sampling work was stopped from May 8 afternoon to 9 morning by strong wind.

#### *GA97 Cruise*

The cruise was carried out by the Asia-maru belonging to Dokai Tugboat Co. for 19 days from July 30 to August 17. The list of onboard researchers and the research cruise log of the GA97 cruise are shown in Tables I-3 and I-4.

During the first leg of the cruise from July 31 to August 3, submarine topographic survey was carried out on the area of Kumano Trough and Nankai Trough by the long-range side-scan sonar "IZANAGI." On August 4, the ship entered to Matsuzaka Port for changing the equipment and exchange of some researchers. After that, single-channel seismic reflection surveys at night and grab sampling works at day time were continued till August 10. During the leg, as the crane for sampling work was damaged, the ship entered to the Omaezaki Port for repair on August 6. The ship entered again to the Omaezaki Port for supplement on August 10. During the last leg, seismic survey in night and sampling works in day time were repeated from August 10 to 13 like the

													Arrival	

middle leg. Finally multi-channel seismic reflection survey was carried out in the Kumanonada Sea from the night of August 10 to the morning of August 16.

About 980 km of single-channel seismic data and about 130 km of 48-channel seismic data were collected from the area during the cruise. Geomagnetic survey and gravity measurement were not conducted during this cruise. The ship collected 56 grab samples.

Although the timing of this cruise was chosen for stable weather and calm sea, a cold front and typhoon sometimes influenced the survey. Sampling work and multi-channel reflection survey have not been carried out as originally planed.

#### **Acknowledgment**

We acknowledge with deep gratitude the cooperation to our research cruises generously extended by the local government of the Shizuoka Prefecture and the fisheries cooperatives of the survey areas.

During the cruises, Captain K. Tamori and crew of R/V Hakurei-maru, and Y. Yamaguchi and crew of Asia-maru helped the research.

We deeply acknowledge the above persons.
